RH MANAGEMENT

Integrated Business Management System

Complete System Specification - build-ready handover document for a developer or an AI coding assistant

Document	Complete System Specification, Version 1.0
Date	November 2026
System	RH Management Integrated Business Management System (reference implementation: v8)
Domain	crm.rhmanagements.com (production subdomain)
Language of the system	English only - every screen, button, message, email and report in professional English
Purpose	One document that fully describes the system so that another developer (or Claude) can rebuild it completely, with nothing missing

This specification consolidates three sources into a single build-ready document: (1) the owner's original functional specification (Revised edition, 25 sections plus addendum sections 26-38), (2) the owner's spoken additions and corrections given during development, and (3) the delivered reference system (v8), which is the most complete working version of the product. Where the reference system goes further than the original specification, this document describes the reference behaviour, because that is what the business already runs on.

> **How to use this document.** Build the system section by section, in the order given. Section 22 is the acceptance checklist: the build is not finished until every item in it passes. Section 23 lists the few points that are still open and must not be invented - ask the owner for them instead of guessing.

Contents

1	Purpose and scope
2	Product overview and business lines
3	Technology, hosting and installation
4	Global design rules (apply to every module)
5	Roles, users and permissions
6	Module catalogue
7	Core workflow A - Reception, HR, Deployment (Inside Hiring front door)
8	Core workflow B - Inside Hiring: vacancies, marketing, files, fees
9	Core workflow C - Outside Hiring: direct client companies
10	Core workflow D - Outside Hiring: agents and agencies
11	Portals - Candidate, Client, Agent
12	Staff attendance
13	Finance and accounting
14	CRM, HRM, ERP, POS, Projects, IT and Digital, Travel and Tour, Marriage Paybook
15	WhatsApp integration
16	Communication, tasks, calendar, knowledge and content
17	Dashboards and reports
18	Search, import and export
19	Data model and record numbering
20	Security, privacy and audit
21	Non-functional requirements
22	Acceptance criteria and UAT checklist
23	Open points and known limitations - do not invent
A	Appendix A - Page and route list
B	Appendix B - Database tables
C	Appendix C - Demo accounts for testing

1. Purpose and scope

RH Management is a recruitment and manpower-supply business in the UAE. It needs one integrated platform that connects recruitment, manpower supply, HR, CRM, ERP, finance, IT and digital services, travel and tour operations, management reporting and controlled external portals, with an end-to-end

record of every candidate, file, vacancy, client demand, agent submission, payment, interview, selection, visa step and deployment outcome.

The system must be **one custom professional system**, not a copy of any third-party product. ERP-style features (accounting, projects, purchasing, inventory, CRM pipeline, HRM) are included, but they are adapted to RH Management's own business lines (see Section 2) and must never be presented as a clone of another product.

In scope: everything in Sections 6 to 18, all three portals, all dashboards, all reports, the WhatsApp inbox and integration settings, and the admin configuration centre.

Out of scope (see also Section 23): sending WhatsApp messages through a provider (replies are stored as notes only); multi-factor authentication, single sign-on, encryption at rest and malware scanning of uploads; scheduled report delivery.

2. Product overview and business lines

RH Management runs several business lines. Every record that belongs to a line of business carries a **business line** tag, and lists can be filtered by it. The business lines are:

Business line	What it covers
Outside Hiring	Bulk manpower supplied to client companies, directly or through agents and agencies.
Inside Hiring	Individual candidates who come to the RH office, are interviewed by RH HR, have a file opened, and are matched to opportunities by the deployment team.
Marketing	Vacancy advertising, campaigns, posts, leads and enquiries that feed Inside Hiring.
Chairman Services	A dedicated line for chairman-level services. The exact service list is an open point (Section 23) - the line, its filters and its record tagging must exist from day one, and the service catalogue is filled in when the owner supplies it.
General	Company-wide records that do not belong to one line (general HR, finance, admin, content).

The two hiring models must stay strictly separate in the data and in the screens, because their money, documents and stages are different:

- **Inside Hiring:** the candidate pays RH Management a fee (advance on file opening, balance after selection). RH Management finds the opportunity.
- **Outside Hiring:** the client company (or its agent) asks for a number of workers. RH Management supplies, documents, tests and mobilises them. Money flows between RH Management, the client and the agent, not from the worker.

3. Technology, hosting and installation

The reference system is deliberately built on the simplest stack that runs on ordinary shared hosting, so that it can be deployed without a server administrator. A rebuild must keep the same deployment simplicity unless the owner explicitly approves a heavier stack.

Item	Requirement
Language and runtime	Plain PHP (7.4 or higher; production runs PHP 8.1 / 8.2). No Composer packages, no Node build step, no framework.
Database	SQLite through PDO (`pdo_sqlite` must be enabled). One file: `data/rh.sqlite`. No MySQL, no separate database server, no database import step.
First run	On first visit the database file is created automatically and seeded with demo data (roles, demo users, sample records). Deleting `rh.sqlite` therefore destroys all data and recreates a fresh demo database - the system must warn about this, and backups are the owner's responsibility.
File layout	All application files sit at the site root so that `login.php` is at the root URL. Uploaded CVs go to `uploads/cv/`. No other upload directories are required.
Permissions	`data/` and `uploads/` must be writable (775 is normally enough on shared hosting).
Protection	`data/.htaccess` and `uploads/.htaccess` must deny direct web access. Direct requests such as `/data/rh.sqlite` must return 403. CV downloads therefore go through a PHP handler, never a direct link.
Frontend	CSS and vanilla JavaScript only, inline or in `assets/`. No build step, no frontend framework. The interface is animated and professional (cards, transitions, dashboard charts drawn without a chart library dependency).
Production domain	`crm.rhmanagements.com` (subdomain). The subdomain has its own File Manager in the hosting panel - uploads go there, never into the main domain's folder. On upload, never overwrite the live `data/` folder.
Backup	Backup = download `data/rh.sqlite` plus the `uploads/` folder. Nothing else holds business data.

> **Hosting fault to handle explicitly.** If the PHP SQLite driver is missing, the system must show a plain-language error telling the owner to enable `pdo_sqlite` in the hosting panel (PHP 8.1 / 8.2), not a raw PHP fatal error.

4. Global design rules (apply to every module)

These rules were set by the owner and apply everywhere. A rebuild that breaks any of them is not acceptable, even if individual screens look right.

- **English only.** The entire interface - menus, buttons, labels, messages, emails, reports, portal screens - is in professional English. No other language appears anywhere in the system.
- **Add is mandatory everywhere.** Every list, register and module has an Add function. Nothing is view-only by design.
- **Rows, not walls of forms.** Lists show records as rows. Clicking a row opens its View / Edit screen. Entry forms open only when the user clicks "Add New". No page may present a long open form as its default view.
- **Action buttons on detail pages.** A record's detail page shows action buttons (for example Edit, HR, Pay, Deploy, Location, Interview, File, Team, Registration Link, Deployment Payment, Final Outcome, File Close, Message) and renders only the form for the action the user selected.
- **"Other" option on major dropdowns.** Every major dropdown includes an Other option which reveals a required detail field, so an unclassified value is always explained rather than silently accepted.

- **One source of truth.** Every candidate, candidate file, vacancy, client demand, agent, client company, payment and deployment case has one unique record number (see Section 19).
- **Full traceability.** Record who created, viewed, assigned, updated, approved, rejected, deleted or restored a record, with date and time and change history.
- **Configurable, not hard-coded.** Administrators maintain positions, status lists, payment types, document types, issue reasons, enquiry and service categories, custom fields, fee plans and portal content without a developer.
- **Financial history is never hard-deleted.** Corrections use reversal / void entries with authorisation and an audit entry. Records with financial or legal links cannot be permanently deleted; they are archived and can be restored by an admin.
- **Confirmations.** Destructive actions ask for confirmation first.
- **Portals see only their own data.** A candidate sees only their own file; a client sees only their own demands; an agent sees only their own submissions. Internal notes, other parties' data and other parties' money are never exposed in any portal.
- **Forward-only stages.** Hiring stages advance forward only through a single controlled stage-advance function. There is no "go back a stage" button; corrections are made by authorised edits and audit entries, not by rewinding the workflow.

5. Roles, users and permissions

Access is role-based at two levels: **module access** (which screens a role may open) and **action permissions** (add, edit, delete, approve, assign, export, finance posting, configuration) within those modules. Permissions are stored per role, not per user, and an admin can duplicate a role and adjust it.

Role	Typical modules	Notes
Super Admin	All modules, including Admin Control Centre and Audit Report	Only this role may open the Admin Control Centre and the full audit trail.
Reception	Dashboard, My Dashboard, Reception, Candidates	Add and edit on; delete and finance off. Cannot open the Admin Control Centre.
HR	Dashboard, My Dashboard, Candidates, Inside Hiring, HRM, Recruitment	Owns interviews, file decisions and HR productivity.
Deployment	Dashboard, My Dashboard, Deployment, Candidates	Owns teams, interview locations, deployment payments, final outcomes and file closure.
Finance	Dashboard, Finance, Accounting, Invoices, Fees, Reports	Owns ledgers, receipts, reconciliation and finance posting.
Marketing	Dashboard, Marketing, Vacancies, CRM leads	Owns vacancy board, campaigns, posts and lead capture.
Travel Team	Dashboard, Travel and Tour, Bookings	Owns packages, enquiries, bookings and supplier payments.
IT / Digital	Dashboard, IT and Digital, Projects, Support	Owns service catalogue, projects, milestones, tasks, change requests and tickets.

Staff and Roles administration (Super Admin only). The admin can add new staff, create new roles, tick which modules a role may open, set its action permissions, and duplicate an existing role. A role that is missing a module (for example, a Deployment role without the Deployment module) is a configuration bug: seeded and newly created roles must always carry the modules their job needs.

Support visibility rule. The Support Dashboard is visible to Super Admin by default; other staff see it only when the admin ticks the support module in Staff and Roles.

Login and password rules. Staff log in with username and password. Every demo password must be changed on first login, and the system must prompt for this. Candidate, client and agent portal logins are separate accounts (Section 11) and never grant staff access.

6. Module catalogue

Every module below must exist in the rebuild. The list is the delivered v8 module set, organised by area. Detail for the hiring modules is in Sections 7 to 11; detail for the rest is in Sections 12 to 18.

Area	Modules (screens)
Home and personal	Dashboard (live counters, demand progress); My Dashboard (personal workload, overdue items, upcoming interviews); Search (global search); Tasks and Alerts; Calendar; Meetings; Messenger; Notifications
Inside Hiring front door	Reception (today's entries, HR-assign queue, ready-for-deployment queue, attendance); Candidates (candidate master); Candidate Registration (self-registration); Deployment (My Candidates, teams, interview locations, payments, file close); Inside Hiring (files, fees, balances); Recruitment (pipeline dashboard, offers, onboarding, assessments, interview rounds, job locations, custom questions, checklists)
Outside Hiring	Outside Hiring (companies, demands, agents, batches, workers); Outside Ops (demand approvals, interviews, tests, training, demand closure, client reconciliation, agent communications, agent performance, agent payments, client invoices)
Sales and marketing	Marketing and Vacancies (vacancy board, campaign posts, enquiries); CRM (leads, pipeline, deals, proposals, communications, follow-ups, conversion); POS (sales, barcode labels, top-selling items)
People	HRM (employees, attendance, shifts, overtime, holidays, leave, payroll preparation, payslips, performance, training, disciplinary cases, employee requests, employee self-service); Staff and Roles (admin)
Money	Finance (ledger, wages, balances); Fees (fee plans, receipts); Invoices (estimates to invoices, credit notes, returns); Accounting (double-entry journals, chart of accounts, bank accounts and transactions, balance sheet, budgets)
Operations	ERP and Operations (contracts, suppliers, purchase requests and approvals, purchase orders, warehouses, inventory, stock transfers, assets, work orders); Projects (business-line tagged projects, milestones, tasks, bugs); IT and Digital (service catalogue, project lifecycle, change requests, client approvals, support tickets, campaign and content calendar)
Travel and personal services	Travel and Tour (packages, enquiries, quotations, bookings, supplier payments, support cases); Marriage Paybook (files, agreed value, payments, balances, work tasks, communications, consultations, refunds with Finance confirmation, marketing conversion counts)
Communication and content	WhatsApp Inbox and Settings; Email templates and log; Notification templates; CMS (pages); Media library; Knowledge Base; FAQ; Newsletter subscribers; Support dashboard and tickets
Control	Reports (executive KPIs, funnels, productivity, finance aging, document and visa tracking, saved views, Candidate Journey); Admin Control Centre (custom options, custom fields, archive and restore, role duplication, action permissions); Audit Report; Settings
Portals	Candidate Portal; Client Portal; Agent Portal (see Section 11)

Business-line tagging. Projects, CRM deals, meetings, company goals, POS sales, knowledge-base articles and FAQs all carry a business-line tag and a business-line filter, so each line of business can be reported separately.

7. Core workflow A - Reception, HR, Deployment (Inside Hiring front door)

This is the workflow the owner uses every day. A walk-in candidate is registered at Reception, interviewed by HR, given a file, and then handled by Deployment. Every step below is mandatory in the rebuild.

7.1 Candidate entry at Reception

The entry form opens only from "Add New". Required fields: full name, contact details (including phone), nationality, applied position, source, and **CV upload (required on every new entry)**. Accepted CV formats: PDF, DOC, DOCX, JPG, PNG, maximum 10 MB, stored in `uploads/cv/` and downloadable only through the PHP handler. Optional but important fields: expected salary (AED), visa type (dropdown with exactly: Visit, Cancel, Employment, Family, Sponsor, Other), "Through Whom" (who referred or sent the candidate), and **"Assign to HR (optional)"** - choosing an HR officer here sets the candidate's assigned HR officer and moves the stage to HR Assigned at save time.

7.2 Reception queues

The Reception screen shows, as rows (never as open forms): today's entries; the HR-assign queue (entries waiting for an HR officer); the ready-for-deployment queue; and a manual staff check-in / check-out box (Section 12). Each queue row shows the candidate plus **Interview status, File status, Paid amount, Remaining amount and Next Pay Date**, so Reception can answer a candidate's payment question without opening Finance.

7.3 HR interview and file decision

HR records the interview outcome: Pending, Selected, Rejected or On Hold, with interviewer notes. HR then records the **File Decision**:

- **Yes (open a file):** the system records the agreed totals and automatically creates the Inside file (shared file-creation logic, so the file is identical whether it is created from HR or from Inside Hiring). The candidate moves to Deployment.
- **No:** HR records whether the candidate "Will come later" or another reason, and the candidate stays out of Deployment.

7.4 Deployment: My Candidates, teams and interview locations

- **Deployment teams** can be created and managed (team name, leader, members). Assigning a candidate to a team, and assigning a candidate directly to a deployment officer, both appear under that officer's **"My Candidates"** tab, with full candidate detail and CV download.
- **Assigning a candidate to Deployment also creates the candidate's portal login** (Section 11) and shows the registration link on screen.
- **Interview location sequence (mandatory).** Deployment sends an interview location to the candidate (sequence numbers are automatic: 1st, 2nd, 3rd, and so on). In the Candidate Portal, under "My Interview Locations", the candidate marks each location **Selected, Not Selected, or Issue**, with a note. Deployment then sends the next location. This repeats until the process ends with a **Final Outcome plus a reason**, recorded on the candidate (a rejection or reschedule at any step requires a reason).
- **Deployment payment update.** Deployment can update a candidate's payment status; the update keeps the Inside file's advance and balance consistent (one shared payment logic - the file and the deployment view must never disagree).

- **File Close (terminal).** Deployment can close a file with a close reason and closure timestamp. A closed file is terminal: it cannot advance further, it shows a closure banner on the detail page and in the reports journey box, and its Inside file is marked Closed with the same reason and timestamp.

7.5 Candidate detail page

The detail page is the control centre for one candidate. It shows the full record (profile, CV download, file, payments, interview locations, journey) and the action buttons listed in Section 4. Only the selected action's form is rendered. The candidate journey box on this page and in Reports shows Payment Status, File Closed status and Final Outcome.

8. Core workflow B - Inside Hiring: vacancies, marketing, files, fees

8.1 Vacancies and marketing

- An inside vacancy (demand) carries: position, number required, minimum qualifications, salary and terms if approved, location, urgency, open date, expiry date and status. Creating or re-opening a vacancy shows it on the Marketing vacancy board and the HR vacancy board with approved information only.
- Marketing records every post: platform, account or page, campaign, post ID or link, date posted, creative or copy version, assigned marketer, spend if applicable, and lead count.
- Every enquiry links to its source post or campaign; if the source is unknown, the "Other / Unknown" option plus a notes field is used.
- Reports show leads, calls, invitations, office visits, files created and placements per post, campaign, platform, marketer and vacancy. Admin can pause, close, reopen, edit or duplicate a vacancy, with change history and permission checks.

8.2 Invitation, office visit and HR interview

Marketing and Sales log calls, messages, comments, invitations, follow-ups, responses, preferred interview dates and notes. The candidate receives office interview instructions. HR registers arrival and attendance, verifies contact details, conducts the interview, records the result and interviewer notes, and marks no-show, reschedule or alternate role where applicable.

8.3 Candidate files, fee plans, receipts and balances

- File creation generates a unique file number and captures profile, CV, applied position, skills, experience, documents, source post, HR owner, file creation date, fee plan, amount collected and receipt.
- **Fee plans are named and versioned.** A file links to a fee plan with an agreed total, currency, payment milestones and acknowledged terms. The standard pattern is an initial amount collected when HR opens the file and a remaining amount payable after selection, but the plan - not the code - defines the amounts, the due event and the due date.
- Receipts (RCT- numbers) support multiple partial payments against one file. Balance is always agreed total minus valid payments and credits. Selection triggers a task or alert when a balance becomes due. Due dates, payment promises ("the candidate says they will pay on..."), reminder schedules and follow-up owners are recorded.
- Refunds, waivers, credits and write-offs are only for authorised roles, through reversal entries with reason and approval history. Finance reconciliation views list collected, due, overdue, disputed and refunded amounts by day, HR officer, file, candidate and payment type.
- Closure outcomes (hired or placed, withdrawn, inactive, unsuccessful, archived) always carry a reason and complete history.

8.4 HR productivity and management oversight

Reports must show, per HR officer and per period: files created; candidates interviewed, attended, absent, screened, approved for file creation, rejected or referred to deployment; total initial payments collected; and **total value of files created, shown separately from actual cash collected**. Also: candidate counts by position, nationality, source post or campaign, qualification and status; the conversion funnel (enquiries, invitations, office visits, interviews, files opened, deployment interviews, selections, placements); average times (enquiry to HR interview, file creation to first deployment interview, selection to closure); pending file tasks, missing documents, candidate issues, overdue balances and files without a next action.

9. Core workflow C - Outside Hiring: direct client companies

Outside Hiring is demand-driven: a client company asks for a number of workers for a position, and RH Management supplies, documents, tests and mobilises them.

Stage	Required behaviour and data
1. Company setup	Legal and display name, industry, branches and sites, contacts, contract details, account manager, billing terms, approved roles, service terms, status.
2. New demand	Demand number; company; job position; quantity; job description; skill and experience; salary, benefits and terms; work location; shift; deadline; interview, test and training requirements; documents; contract or PO; priority; demand owner.
3. Demand approval	Authorised approval before recruitment starts; approved quantity, replacement policy, fees or rates if applicable, contract version and amendments recorded.
4. Sourcing and submission	Each candidate or worker links to the demand and position; submission date, submitted by, CV and documents, profile version and client response recorded.
5. Interview, assessment, training	Location, date and time scheduled; attendance; test or training type; assessor; result; score or feedback; pass, fail or pending; reschedule and issue reason.
6. Selection / rejection	Selected, rejected, on-hold or alternate position; decision maker, date, reason, client feedback and next action. Rejection requires a reason.
7. Documents and authorisation	Required documents tracked with verification, missing or corrected status, authorisation, permit and visa milestones and expiry dates.
8. Mobilisation and joining	Travel and mobilisation plan where applicable; planned and actual departure; arrival; onboarding; joining date; worksite; supervisor; deployment confirmation; no-show or replacement.
9. Issues and replacements	Issue case with severity, owner, due date, updates, resolution and linked replacement candidate or revised demand.
10. Demand closure	A demand closes only when every requested slot is categorised as deployed, cancelled, unfilled, rejected, withdrawn or otherwise resolved. Full history is preserved.

9.1 Company-side travel record (owner requirement, both sides)

Travel is recorded from **both sides**: the worker's own travel record and the **company-side travel record**. Each side records travelled, pending or did-not-travel, plus a reason when travel did not happen, plus a replacement where one is arranged. The company demand progress table shows, for each demand, how many workers were arranged, their documents, the season, payments made and full progress.

9.2 Direct client dashboard

Requested headcount versus submitted, interviewed, selected, rejected, in documentation, visa or authorisation pending, ready to mobilise, joined and still outstanding; breakdown by company, demand number, position, site, nationality where relevant, owner, stage and date range; the full list of workers supplied to the client with position, submission date, test result, selection status, visa status, issue or reason and current owner; contract, demand changes, rate and terms, invoice and payment status and linked service history; alerts for demand deadlines, pending client feedback, overdue documents, visa delays, failed tests, joining delays and unfilled headcount.

10. Core workflow D - Outside Hiring: agents and agencies

- **Agent and agency master:** agency name, individual agent name, contacts, location and country, approved status, agreement or contract, permitted source countries, responsible RH owner, compliance and document notes.
- **Demand allocation:** an agent or agency links to a specific client demand and position, with agreed target quantity, submission deadline, document checklist, terms and assigned RH coordinator.
- **Batches:** the same agent can have multiple batches; every submitted candidate remains individually traceable to their batch, agent, demand and position.
- **Agent portal** (Section 11) shows the agent their own submissions, documents, processing progress, issues, payment terms and receipts - never other agents' data.
- **Agent finance:** agent payments, payment terms, receipts and balances, reconciled in Finance like client balances.
- **Agent performance:** submissions, selections, rejections, mobilisation and issue rates per agent and agency, reported alongside client demand progress.
- **Agent communications:** messages and follow-ups with agents are logged against the allocation or batch, with assignment and timestamps.

11. Portals - Candidate, Client, Agent

Portals are separate logins with separate screens. Portal users never see staff screens, internal notes, other parties' records or other parties' money.

11.1 Candidate Portal

- **Login by email (current rule).** The portal username is the candidate's **email address** (trimmed and lowercased on login). Older slug-based logins continue to work as a fallback for accounts created before this rule. The candidate also needs a password.
- **Self-registration.** A candidate can self-register through a registration link. Registration issues a 32-character token valid for 7 days, and the link is always shown on screen to staff (email delivery is unreliable on shared hosting, so the link must never be email-only). On the registration form the username (email) is shown read-only; the candidate sets only a password and confirms it.
- **Portal login creation.** When Deployment assigns a candidate (directly or through a team), the portal login and registration link are created automatically and shown to staff.
- **What the candidate sees:** profile, CV, skills, experience, preferred positions and approved documents; file number, file creation date, applied position, current stage and a clear progress timeline; interview opportunity cards (company and position if permitted, date and time, exact location or map link, contact and instructions, required documents, attendance confirmation, reschedule request); status updates (invited, interview scheduled, attended, awaiting feedback, selected, rejected,

alternate position offered, pending documents, payment due, closed); **"My Interview Locations"** where the candidate marks each location Selected, Not Selected or Issue with a note (Section 7.4); payment summary (approved total fee, initial amount paid, amount due after selection, due trigger and date, receipts, balance); issue and help centre (raise an issue, ask a question, upload a missing document, request a schedule change - every conversation timestamped and assigned to a deployment team member).

- **What the candidate cannot change:** official status, selection outcome, fee terms and internal notes are staff-controlled. The candidate may update permitted fields only.
- **Legacy file login.** A candidate may also log in with file number plus phone number (the original portal login method). Both login methods must keep working.

11.2 Client Portal

Approved job demand details; submitted candidate profiles and CVs; interview outcomes; document, visa and deployment progress; and issue tracking for the client's own demands only. The client sees headcount progress (requested versus submitted, interviewed, selected, in documentation, mobilised, joined) and can raise issues against a demand. Client users are managed by staff; a client account is tied to one client company.

11.3 Agent Portal

Agent or agency profile; worker submissions by position; documents; processing progress; issues; payment terms and receipts - for the agent's own submissions only. Agent users are managed by staff; an agent account is tied to one agent or agency.

12. Staff attendance

- Every staff panel - My Dashboard, Reception, HRM and Deployment - shows a personal **check-in / check-out box** for the logged-in user. One attendance record per user per day (unique user plus date); checking in twice does not create a duplicate day.
- Reception also has a **manual attendance box** for all login-users, so Reception can mark attendance for staff who did not check in themselves.
- HRM shows the **Staff Attendance Register**: all staff, all days, with check-in and check-out times, for admin review.
- Attendance is separate from HRM leave, shifts and overtime (Section 14), but the register feeds HRM reporting.

13. Finance and accounting

- **Payment ledger:** every candidate payment, agent payment, client payment, wage and expense is a ledger entry linked to its file, demand, agent or client. No payment exists without a linked record and a receipt or reference.
- **Candidate balances:** agreed total, advance, partial receipts, balance after selection, due dates and promises, overdue flags - consistent between the file view, the deployment view and Finance (one shared payment logic).
- **Agent and client balances:** amounts due, paid, outstanding and disputed, with invoices and receipts, reconciled per company, demand and agent.

- **Invoices and estimates:** estimates convert to invoices; invoices support credit notes, returns and partial payments; invoice returns and purchase returns are separate, audited flows.
- **Double-entry accounting:** journal entries with debit and credit, chart of accounts, and a balance sheet. Bank accounts exist as records, and every bank transaction updates the account balance. Budgets and budget allocations exist per period and line.
- **Wages and payroll preparation:** wage records feed payroll preparation with payslip views. Payroll inputs come from HRM attendance, leave, overtime and shifts.
- **Daily finance reports:** collections, dues, overdue amounts and balances by day, with the finance dashboard listing collected, due, overdue, disputed and refunded amounts by day, officer, file, candidate and payment type.
- **Controls:** only authorised roles post finance entries; corrections use reversal entries; financial history is never hard-deleted; every export, status change and reversal is written to the audit log.

14. CRM, HRM, ERP, POS, Projects, IT and Digital, Travel and Tour, Marriage Paybook

14.1 CRM

Leads with source and owner; sales pipeline and deals (business-line tagged); client companies and contacts; proposals and quotations; communication logs; follow-up tasks with overdue flags; lead-to-client conversion with history. CRM deals carry the same business-line tag and filter as projects and meetings.

14.2 HRM

Employee records with documents; attendance (see Section 12); shifts; overtime; holidays; leave requests with balances and approve or decline actions; payroll preparation with payslip views; performance indicators and review cycles; trainers and training types; announcements, awards, promotions, transfers, resignations and terminations; disciplinary cases; employee requests; and employee self-service (staff see only their own linked record).

14.3 ERP and Operations

Contracts with contract types; suppliers and vendor bills; purchase requests with approvals; purchase orders; warehouses; inventory with stock movement; stock transfers between warehouses; assets with assignment; work orders with delivery and cost tracking.

14.4 POS (point of sale)

Sales recorded per business line, with sale items, barcode labels for products, and a top-selling items report.

14.5 Projects

Projects tagged by business line, with milestones (including goal milestones) whose completion percentage is calculated from tasks only, tasks with time and cost tracking, and a bug register.

14.6 IT and Digital Solutions

Service catalogue; projects through the lifecycle Lead, Discovery, Quotation, Approval and Contract, Milestones, Testing and UAT, Deployment, Support and Renewal; milestones with completion from tasks only; tasks with time and cost tracking; change requests; bug register; client approvals; support tickets; campaign and content calendar.

14.7 Travel and Tour

Packages; enquiries; quotations; bookings with customer-paid versus supplier-paid versus outstanding payable and profit and margin; supplier payments; support cases; a Travel and Tour team dashboard. Travel bookings are a different record from hiring travel and mobilisation (Sections 9 and 7) and must not be mixed with them.

14.8 Marriage Paybook

Files with agreed value, payments and balances; work-progress tasks; communication history; consultation and meeting records; refunds only with Finance confirmation; and marketing conversion counts (how many paybook files came from which marketing source).

15. WhatsApp integration

Owner requirement: WhatsApp integration must switch on by the admin simply pasting the API details in Settings - no developer, no code change.

- In **Settings**, the admin pastes the WhatsApp Business provider's API key (access token) and Phone Number ID and saves. Saving turns the integration on.
- The system displays its **webhook URL and verify token**. The admin enters these in the provider's dashboard (Meta, 360dialog, Interakt or similar) and subscribes to the `messages` webhook.
- **Webhook endpoint** (`webhook.php`) handles Meta verification and stores incoming messages, with a webhook event log.
- **WhatsApp Inbox:** centralised enquiries with categories, assignment to staff, linking to candidate files, clients, demands, bookings, projects and paybook files, staff reply notes, a manual review queue for ambiguous messages, an integration health screen, and reports.
- **Manual entry:** staff can also enter WhatsApp enquiries manually, so conversations that arrive outside the webhook are still recorded in the same inbox.

> **Honest limitation the new developer must know.** Real WhatsApp send and receive requires a WhatsApp Business provider account. A personal WhatsApp account cannot be read automatically. In the reference system, staff replies are stored as conversation notes; sending a message out through a provider is not performed by the package. If the owner wants true two-way sending, that is a defined extension (provider send API + message templates + opt-in handling), not a bug fix.

16. Communication, tasks, calendar, knowledge and content

- **Messenger:** internal staff messaging with conversations, assignment and history.
- **Calendar and Meetings:** calendar view of interviews, meetings and deadlines; meetings carry a business-line tag, attendees, agenda and a **Zoom link field (paste the link; the system does not create Zoom meetings)**.
- **Notifications and email:** notification templates and an email template library, with an email log recording what was sent, to whom and when.
- **Tasks and Alerts:** system-generated tasks (selection balances, document corrections, overdue issues, visa delays, pending feedback) with severity and SLA escalation flags, plus manual tasks, all with owners and overdue flags.
- **CMS and Media:** content pages managed in the CMS, and a media library for uploaded files and images.

- **Knowledge Base, FAQ, Newsletter:** knowledge-base articles (business-line tagged), FAQs (business-line tagged) and newsletter subscribers, managed from the admin screens.
- **Support:** support tickets and a support dashboard (visibility per Section 5).
- **Company Goals:** company goals with milestones, business-line tagged, reported on the management dashboard.

17. Dashboards and reports

Every dashboard shows **live counters computed from records**, never typed-in numbers. If a counter and a list disagree, that is a bug.

- **Management dashboard:** cross-module KPIs, team progress, exceptions, approvals and audit visibility.
- **Role dashboards:** Reception (registration queue), HR (files, interviews, productivity), Marketing and Sales (vacancies, posts, leads), Deployment (candidates, locations, payments, closures), Finance (collections, dues, aging), Travel and Tour, IT and Digital - each showing only that team's work.
- **Reports:** executive KPIs; the Inside hiring funnel with conversion rates; HR productivity (file value shown separately from cash collected); deployment and marketing performance; finance aging; document and visa tracking; average file-to-opportunity time; saved report views (a user can save a filtered view and reopen it).
- **Candidate Journey box** (candidate detail and Reports): stage history plus Payment Status, File Closed status and Final Outcome.
- **Demand progress tables:** for every outside demand, requested versus submitted, interviewed, selected, rejected, in documentation, visa pending, ready to mobilise, joined and outstanding - on both the client side and the agent side.

18. Search, import and export

- **Global search** across candidates, files, clients, demands, agents, batches, receipts and issues, from one search box.
- **CSV export** for authorised roles; every export is logged (who exported what, when).
- **CSV import** with validation, duplicate detection and an error report shown **before** committing, so a bad file never half-imports.

19. Data model and record numbering

The reference database uses 87 tables (Appendix B). The rebuild may normalise differently, but it must preserve every entity, every relationship below, and every numbering rule.

Entity	Numbering / key rule	Core relationships
Candidate	CAN- number, unique per person	Has many applications (APP-), interviews and tests (INT-), deployments (DEP-), issues (ISS-), documents, messages.
Inside file	IN-FILE- number, unique per file	Belongs to one candidate; carries fee plan, advance, balance, due date, HR owner, deployment owner, stage, close reason and timestamp.
Inside vacancy	IN-REQ- number	Has many campaign posts, enquiries, invitations and files.
Receipt	RCT- number	Belongs to one file; partial payments allowed; reversals are separate entries, never edits.
Company and demand	Demand number, unique per demand	Company has many demands; demand has many submissions, interviews, workers, issues and invoices.
Agent and batch	Batch per agent per demand	Agent has many batches; batch has many workers; worker traces to one batch, agent, demand and position.
Worker (outside)	Linked to demand and position	Carries stage, documents, visa, ticket, travel status (both sides), no-travel reason, replacement link and wages.
Interview location	Auto sequence per candidate (1st, 2nd, 3rd...)	Belongs to one candidate; carries candidate response (Selected, Not Selected, Issue) plus note; ends in a Final Outcome with reason.
Attendance	Unique user plus date	One record per user per day; check-in and check-out times.
Invoice, estimate, credit note	Own sequences	Estimate converts to invoice; invoice has items, returns, credit notes and payments.
Journal entry	Double-entry (debit = credit)	Links to accounts, bank transactions, invoices, payments and budgets.

Duplicate detection. Candidate entry and CSV import must detect likely duplicates (same phone, same email, same document) and show the duplicate-check result before creating a second record. **Archiving:** records with financial or legal links are archived, not deleted, and an admin can restore them.

20. Security, privacy and audit

- **Role checks on every page and every action.** A user who lacks a module or an action permission must be refused, not merely hidden from the menu. In particular, the Admin Control Centre is refused to every non-admin role.
- **Portal isolation.** Every portal query is scoped to the logged-in party's own records. There is no portal screen, export or message that can reach another party's data.
- **Direct file protection.** `data/` and `uploads/` deny direct web access (Section 3); CVs download only through the authenticated handler.
- **Form protection.** All state-changing forms carry a CSRF token, and every hidden field the form renders must be submitted back, so that submissions validate completely.
- **Audit log.** The audit trail records actor, action, record, old value, new value, reason (for status changes and financial reversals) and timestamp. Exports, permission changes, status changes and financial reversals are always logged. The full audit report is Super Admin only.
- **Sensitive data.** Identity, CV, passport, visa, salary and payment data are access-logged and retention-controlled. Field-level masking is enforced at module level through roles, not per individual field (see Section 23).

- **Passwords.** Demo passwords must be changed on first login. The system must never store or display another user's password.
- **Legal validation note.** Visa, fee, privacy, accounting and employment rules in this specification are business requirements, not legal advice. The owner and qualified advisers must validate them before production use.

21. Non-functional requirements

- **Shared-hosting performance.** Pages must load acceptably on ordinary shared hosting with a SQLite file database. No step may require a background worker, queue server or separate service.
- **Mobile-friendly.** Staff screens and all three portals must be usable on a phone browser (Reception and candidates are often on phones).
- **Animated professional interface.** The reference interface is animated (cards, transitions, dashboard charts) using CSS and vanilla JavaScript only. A rebuild must look and feel professional, not like a raw admin table dump.
- **No build step, no paid dependency.** The delivered system needs no Composer install, no Node build and no paid library. Any replacement dependency must be free and must be approved by the owner.
- **English only, again.** This applies to error messages, validation messages, emails and PDF or CSV exports as well as screens.

22. Acceptance criteria and UAT checklist

The build is finished only when every scenario below passes on a fresh install (fresh database, demo seed) and on an upgraded install (existing database kept intact, with data-preserving migrations).

1. Fresh install: first visit creates the database and seed data; login page loads; all demo logins in Appendix C work; every module page returns a successful page for a user with that module (no blank screens, no fatal errors).
2. Reception flow end to end: add a candidate with a CV upload (upload required - the form must refuse without it); assign to HR at entry; Reception queues show Interview, File, Paid, Remaining and Next Pay Date; HR records interview outcome and a Yes file decision, which creates the Inside file with the agreed totals; the candidate appears in Deployment.
3. Deployment flow end to end: create a team, assign the candidate, confirm the portal login and registration link are created and shown; send interview location 1, mark it in the portal (Selected, Not Selected and Issue are all testable), send location 2, record a Final Outcome with reason; update deployment payment and confirm the Inside file balance matches; close the file with a reason and confirm it is terminal, bannered, and the Inside file is Closed with the same reason.
4. Inside money flow: fee plan with advance and post-selection balance; two partial receipts against one file; balance arithmetic correct in the file view, the deployment view and Finance; a refund only through a reversal entry with reason; finance history never editable in place.
5. Outside flow end to end: company, demand, approval, agent allocation, batch, worker submission, interview or test, selection, documents, visa milestone, travel status on both sides (including a did-not-travel case with reason and replacement), issue case, demand closure only when every slot is categorised.
6. Portals: candidate login by email works and the legacy file-plus-phone login still works; candidate self-registration link is shown on screen, token lasts 7 days, username is read-only email on the form;

client sees only their own demands; agent sees only their own submissions; internal notes are invisible in all portals.

7. Attendance: check-in and check-out work from My Dashboard, Reception, HRM and Deployment; one record per user per day; Reception manual box marks another user; the HRM register lists all staff.
8. Permissions: a Reception user cannot open the Admin Control Centre or post finance; a Deployment user without the deployment module (simulated by unticking it) is refused the Deployment screen; role duplication copies modules and actions.
9. WhatsApp: pasting a token and phone ID in Settings turns the integration on and displays the webhook URL and verify token; the webhook endpoint answers verification; an incoming test message lands in the Inbox and can be categorised, assigned and linked to a file.
10. Money integrity: journal entries always balance (debit equals credit); a bank transaction updates its account balance; an estimate converts to an invoice; a credit note and a return post correctly; the balance sheet reflects posted entries.
11. Search, import, export: global search finds a candidate, a demand and a receipt; a CSV export is logged; a CSV import with a duplicate and an invalid row shows an error report before committing and imports nothing until corrected.
12. UX rules: no list page shows a wall of open forms; forms open only on Add New; detail pages show action buttons and render only the selected action's form; every major dropdown offers Other with a required detail field.
13. Hosting: `/data/rh.sqlite` returns 403; CVs download only through the handler; uploading the package over an existing install without touching `data/` keeps all business data; a missing `pdo_sqlite` driver produces the plain-language hosting error, not a fatal dump.
14. Language: a full click-through of every module and portal shows English only - no other language in any label, button, message or report.

23. Open points and known limitations - do not invent

- **Chairman Services service list.** The owner has not yet supplied the exact Chairman Services list. Build the business line, its tagging and its filters (Sections 2 and 6), and leave the service catalogue to be filled in from the owner's list when it arrives. Do not invent chairman services.
- **Further owner additions.** The owner has said more items will follow. Build everything in this document first; treat later items as additions, never as replacements - nothing already built is to be removed to make room for a new item.
- **WhatsApp sending.** Two-way sending through a provider is not in the reference system (Section 15). Quote it as an extension if asked, with template and opt-in handling.
- **Not included:** multi-factor authentication, single sign-on, encryption at rest, malware scanning of uploads, scheduled report delivery, dynamic rendering of custom fields into forms (custom fields are definable; the "Other" pattern covers the common cases), and per-field masking (masking is at module level through roles).
- **Demo data.** Demo logins, demo companies, agents and candidates exist for testing only. All demo passwords must be changed before production use, and demo records must be removable without breaking the system.
- **Final upload.** The owner tests every delivery on a live demo link before final upload to `crm.rhmanagements.com`. A delivery is not "done" until the owner has tested it. Placeholder links are not a delivery.

Appendix A - Page and route list

Every file below is a screen or endpoint in the reference system. A rebuild must provide the same coverage; file names may differ, but no screen may be missing. All staff screens sit at the site root; portals are separate logins.

File	Purpose
login.php, index.php, mydash.php	Staff login, home redirect, personal dashboard
admin.php, settings.php, audit.php, staff.php	Admin Control Centre, system settings, audit report, staff and roles
reception.php, candidates.php, candidate_register.php, deployment.php	Reception queues and attendance, candidate master, self-registration, deployment (teams, My Candidates, locations, payments, file close)
inside.php, fees.php, recruitment.php, hrm.php	Inside files and balances, fee plans and receipts, recruitment pipeline, HRM and attendance register
outside.php, outside_ops.php	Outside companies, demands, agents, batches, workers; outside operations and closure
marketing.php, crm.php, pos.php	Vacancies, campaigns, posts, enquiries; CRM pipeline and deals; point of sale
finance.php, accounting.php, invoices.php, erp.php, projects.php	Finance ledger and balances, double-entry accounting and budgets, estimates and invoices, ERP operations, projects
it.php, travel.php, paybook.php	IT and digital services, travel and tour, marriage paybook
calendar.php, meetings.php, messenger.php, notifications.php, tasks.php	Calendar, meetings, internal messaging, notifications, tasks and alerts
cms.php, media.php, support.php	Content pages, media library, support tickets and dashboard
whatsapp.php, webhook.php	WhatsApp inbox, settings and health; provider webhook endpoint
reports.php, search.php, delete.php	Reports and Candidate Journey, global search, controlled delete and archive handler
portal.php, client_portal.php, agent_portal.php	Candidate portal, client portal, agent portal
inc/db.php, inc/functions.php, assets/app.js, assets/style.css	Database and seed logic, shared functions (stage advance, file creation, payments, attendance, permissions), frontend script and stylesheet

Appendix B - Database tables

The reference database uses the following 87 tables. A rebuild may rename or normalise them, but every entity must exist and every relationship in Section 19 must hold.

accounts, agent_users, agents, attendance, audit, bank_accounts, bank_transactions, batches, biz_bugs, biz_projects, biz_tasks, budget_allocations, budgets, candidate_assessments, candidate_logins, candidate_messages, checklist_items, client_feedback, client_users, cms_pages, companies, company_goals,

contract_types, contracts, credit_notes, crm_deals, custom_questions, custom_values, demands, deployment_teams, email_log, email_templates, employees, faqs, finance_entries, goal_milestones, hr_announcements, hr_awards, hr_events, hr_goals, hr_policies, hr_promotions, hr_resignations, hr_terminations, hr_transfers, inside_files, interview_locations, interview_rounds, invoice_returns, invoices, issues, job_locations, job_offers, journal_entries, kb_articles, leads, leave_requests, meetings, notification_templates, onboardings, paybook_files, paybook_tasks, payments, performance_indicators, pos_sale_items, pos_sales, purchase_orders, purchase_returns, review_cycles, roles, saved_views, settings, staff_attendance, staff_messages, stock_transfers, subscribers, timesheets, trainers, training_types, travel_bookings, travel_packages, users, vendor_bills, wa_messages, wa_webhook_log, warehouses, workers.

Notes: candidate master records are held across the candidate-related tables and inside_files (CAN- numbering per Section 19); interview locations have their own table because the location sequence is a first-class workflow (Section 7.4); staff_attendance is separate from HRM attendance history so that the daily check-in rule (one record per user per day) is enforced by a unique constraint.

Appendix C - Demo accounts for testing

> **Change every password on first login.** These accounts exist for testing only and must not be used in production.

Access	Login
Staff - Super Admin	admin / rh@123
Staff - HR, Deployment, Finance, Reception	hr / deploy / finance / reception - each with password rh@123
Client Portal (Gulf Construction LLC)	gulf / client123
Agent Portal (Kathmandu Manpower Agency)	kathmandu / agent123
Candidate Portal (legacy file login)	File IN-FILE-2026-00001 + phone 0521112233
Candidate Portal (username login)	Candidate email address as username + the password set at registration (demo candidate: Ali Khan, CAN-2026-00001)

End of specification. Companion source: the editable HTML source of this document is kept alongside the PDF so that future revisions start from it, not from a retyped copy.
